

TODAY:

Some Security Notes on Cisco Enterprise WLAN Solutions

Daniel Mende, Enno
Rey

Who we are

- **Old-school network geeks, working as security researchers for**

- **Germany based ERNW GmbH**

- Independent
- Deep technical knowledge
- Structured (assessment) approach
- Business reasonable recommendations
- We understand corporate

- **Blog: www.insinuator.net**

- **Conference: www.troopers.de**

Agenda

- **Introduction & Dimensions of this talk**
- **Technology overview & attack paths**
- **Attacks in the SWAN world**
- **Attacks in the CUWN world**
- **Summary & Outlook**

Background of this talk

- Besides being security guys we (still) do some practical network implementation work.
- When occasionally touching Cisco Enterprise WLAN stuff, we couldn't avoid the feeling that security-wise
... it smelled ;-)

Background of this talk

- **Practically no independent security assessment of this stuff (publicly) available → we built a lab and started fiddling around.**

- **Fortunately some \$VERY_LARGE_ENTERPRISE paid some man-days of this work. Thanks for that! (you know who you are...)**

Goals of this talk

- Provide some publicly available security research ;-)
- Furthermore we'd like to discuss protocol design considerations in general.
- Demonstrate the hidden/obscure vulnerabilities of **\$SOME_TECH_ENTERPRISE_SOLUTIONS** (not just in WLAN space...).

Overview

- **Highly proprietary stuff
(including protocols)**

- not easy to understand and not too well documented either.
- “legal boundaries” when performing security research.

Flavors / Generations

From our perspective three generations can be identified.

- **Structured Wireless-Aware Networks (SWAN)**
- **Based on managed APs & LWAPP**
 - After *Airspace* acquisition in 2005
 - Still some interesting remnants from *Airspace* age present today...
- ***Cisco Unified Wireless Network (CUWN) w/ CAPWAP***

In this talk, we cover 1st (SWAN) & 3rd (CUWN) generations.

Main attack paths

- **Attacks against traffic in transit**

- **Attacks against cryptographic material**

- Somehow related to attacks against traffic in transit ;-)
- Might be used of different purposes though
 - E.g. injection of rogue devices

- **Attacks against components**

- Physical removal/replacement
- Mgmt interfaces (HTTP[S], SNMP et.al.)

Du côté de chez Swan(n)

Figure 3 Access Point-Based WDS Solution

From: <http://www.cisco.com/en/US/docs/wireless/technology/swan/deployment/guide/swandg.html>

SWAN's way – How things work

- **Access points are autonomous but can be “configured by a central entity”**
 - Wireless LAN Solution Engine (WLSE)
 - Wireless LAN Services Module (WLSM) for Cat65K
- **Framework provides some functions entitled as *Wireless Domain Services (WDS)*.**
- **Intra-AP communication mainly done by means of a proprietary protocol: WLCCP.**

- ***Wireless LAN Context Control Protocol***
- **Described essentially in two *US Patents***
 - Wireless local area network context control protocol
 - 802.11 using a compressed reassociation exchange to facilitate fast handoff
- **Provides functions for central mgmt, authentication, radio frequency measurement etc.**
- **Different encapsulations (Ethernet, UDP 2887) used for different types of traffic (local subnet vs. routed traffic).**
- **Basic *Wireshark* parser for some message types available.**

WLCCP internals relevant here I

■ Two types of authentication

- *Infrastructure Authentication* for Intra-AP communication → LEAP
- Client Authentication
→ potentially all Cisco-supported EAP methods

■ Confidentiality and integrity protection by key material

- NSK = *Network Session Key* established during LEAP authentication.
- *Context Transfer Key* (CTK) derived separately, depends on NSK

■ We'll go after the NSKs and derived CTKs later on...

WLCCP internals relevant here II

- *As fast handoff* is an explicit design goal/feature of the SWAN/WDS/WLCCP architecture, a mobile node associating with a different AP must be saved from undergoing a (new) full EAP exchange with authentication server.
- Cisco introduced a proprietary key management framework called *Cisco Centralized Key Management (CCKM)*.
- CCKM includes the support of exchanging already available cryptographic material that is relevant to mobile nodes (e.g. PMKs for WPA) between APs. This exchange is protected by CTKs.

Before we start hacking WLCCP,
some notes from history

- **At ShmooCon 2008 we gave a talk on *Layer 2 Fuzzing*:**

Results – WLCCP

- **Not too many (reliable) results, probably because WLCCP requires quite "some state"**
- **However every now and then APs crash and need hard resets afterwards. So far we are not able to reproduce this behavior in a controlled manner**
- **Next steps:**
 - Reverse engineer the protocol
 - Understand the WLCCP state machine and build different scripts for all the states

Some notes from history, cont.

- Shortly after ShmooCon talk another German security researcher contacted us, for “information exchange on WLCCP”.
- Turned out he had some simple *Scapy* scripts, targeting WLCCP and reliably crashing Aps.
- We initiated disclosure with Cisco and filed his and our findings. Bugs were silently fixed thereafter.

→ Still, all this was not sufficient to phase our interest down...

Back on track: two particularly interesting mimics of WLCCP

- **Perform election of WDS master**
- **Intra-AP communication**
 - Authenticated by LEAP

WDS master election

- **WDS master election performed based on \$PRIORITY**
 - Wasn't there another proprietary Cisco protocol with similar behavior?
=> right: HSRP
 - What happens if \$SOME_ENTITY with higher priority shows up?
=> right: DoS/potentially traffic redirection
 - Clever protocol design?
The jury is still out on that...
 - DEMO

WLCCP intra-AP communication

- Authenticated by LEAP (“encapsulated in WLCCP”).
- But wait: “isn’t LEAP debatable, security-wise”?
- Cisco: “that’s why we generate another key”.
- But... that key generation is based on previous LEAP authentication.
- Clever protocol design?
The jury is still out on that...

CTK derivation

- A simple SHA1 using two nonces and IDs
- NSK for HMAC

Practical attack(s) against WLCCP

■ Get access to “wired AP backbone segment”

- We’ve seen large department stores where everything (WLSE, APs, wired Windows clients, wireless point-of-sale systems etc.) was in *one big flat network* anyway.

```
Interesting ports on 192.168.88.3:
PORT      STATE      SERVICE (3)
2887/udp  open|filtered unknown
MAC Address: 00:40:63:E3:19:BC (VIA Technologies)

Interesting ports on 192.168.88.10:
PORT      STATE      SERVICE (4)
2887/udp  open|filtered unknown
MAC Address: 00:0C:CE:33:32:25 (Cisco Systems)
```

■ Identify WLCCP speakers

■ Sniff intra-AP traffic, crack LEAP, extract NSKs/CTKs

- Strip current WDS master from it’s role if needed ;-)

■ Use CTKs to decrypt PMKs when mobile node roams.

- Decrypt mobile node’s network traffic afterwards...

DEMO
;))

For completeness' sake: WLSE, Attacks against mgmt

The screenshot shows the Cisco Security Advisory page for document ID 50400. The page title is "Cisco Security Advisory: A Default Username and Password in WLSE and HSE Devices". The advisory ID is "cisco-sa-20040407-username". The document is titled "Document ID: 50400" and "Advisory ID: cisco-sa-20040407-username". The URL is "http://www.cisco.com/warp/public/707/cisco-sa-20040407-username.shtml". The revision is "Revision 1.4". The last updated date is "2004 April 12 1700 UTC (GMT)". The public release date is "2004 April 07 1600 UTC (GMT)". The contents list includes: Summary, Affected Products, Details, Impact, Software Versions and Fixes, Workarounds, Obtaining Fixed Software, Exploitation and Public Announcements, Status of This Notice: FINAL, Distribution, Revision History, and Cisco Security Procedures. A magnifying glass icon is positioned over the "Summary" link. The summary text states: "The default username/password pair is present in all releases of the Wireless LAN Solution Engine (WLSE) and Hosting Solution Engine (HSE) software. A user with this username has complete control of the device. This username cannot be disabled. There is no workaround. The exploit is available at http://www.cisco.com/warp/public/707/cisco-sa-20040407-username.shtml".

this username has complete control of the device. This username cannot be disabled. There is no workaround.

CUWN – A simple overview ;-)

Talking about mgmt...what's this?

Message: 550: AP:0026.9937.6d4c: *Mar 1 01:28:39.466: %CAPWAP-3-ERRORLOG: Not sending discovery request AP does not have a

- Main protocol: CAPWAP
- Authentication involves *Datagram TLS* (DTLS, UDP based) with certificates.
- All security relevant data is encrypted and authenticated.

CAPWAP

Bunch of RFCs, mainly

- **RFC 4118 *Architecture Taxonomy for Control and Provisioning of Wireless Access Points***
- **RFC 5415 *Control And Provisioning of Wireless Access Points (CAPWAP) Protocol Specification***

Some additions to other protocols

- **DHCP**
- **802.11**

■ 3.1. UDP Transport

One of the CAPWAP protocol requirements is to allow a WTP to reside behind a middlebox, firewall, and/or Network Address Translation (NAT) device. [...]

When CAPWAP is run over IPv4, the UDP checksum field in CAPWAP packets **MUST** be set to zero.

- Sure man, why use such annoying checksums at all. I mean UDP is reliable transport anyway, isn't it?

CAPWAP – Assessment paths

- **Have a look at the crypto code**
 - Own, proprietary stuff? Re-use of (“open”) libraries?
 - If latter, any known vulnerabilities?
 - Which algorithms in use?
- **Have a look at the certificates**
 - Who trusts who, for which reason (certification path)?
- **We feel there’s some skeletons in the closet
=> Troopers 2011 ;-)**

Included software/ bugs...

```
bash> strings AP-image |grep "art of OpenSSL"
```

Big Number part of OpenSSL 0.9.7b 10 Apr 2003

AES part of OpenSSL 0.9.7b 10 Apr 2003

[...]

SHA part of OpenSSL 0.9.7b 10 Apr 2003

Stack part of OpenSSL 0.9.7b 10 Apr 2003

SSLv2 part of OpenSSL 0.9.7b 10 Apr 2003

SSLv3 part of OpenSSL 0.9.7b 10 Apr 2003

SSLv2/3 compatibility part of OpenSSL 0.9.7b 10 Apr 2003

TLSv1 part of OpenSSL 0.9.7b 10 Apr 2003

Cisco told us they had ported OpenSSL into IOS back in 2003 (and license was reviewed by legal).

CAPWAP – On Certificates

- **Certificates signed by *Cisco's Manufacturing CA (MIC)* installed in the course of manufacturing process.**
- **Per default every MIC certificate is trusted.**
 - So every piece of Cisco HW might be trusted
 - ... even if it was not deployed by yourselves ;-)
- **One can deploy own certificate chain.**
 - Adds even more complexity though.

- **WCS, Webinterface**

- **SNMP ... our old friend ;-)**

- On WLC enabled by default.
- Heavily used for WLC ⇔ WCS communication.
- Classic default communities (public/private).
- Yes, sure, those could (& should) be changed.
- Still, given overall complexity → people happy the stuff runs at all (“we’ll harden it later”...).

WCS – After all, it's a webinterface...

ERNW
Living Security.

SNMP @ WLC

- **Get release number (think “show version”)**
- **Identify APs currently associated (+ some info about)**
- **Get IP configuration of all APs**
 - Can be “set” (on WLC) as well
- **All kinds of key stuff with strange names.**

SNMP @ WLC, Syslog data?

SNMPv2-SMI::enterprises.14179.1.1.2.4.1.22.10111 = STRING: " Rogue AP : 00:23:08:65:2a:f8 removed from Base Radio MAC : 00:21:1b:eb:60:70 Interface no:0(802.11n24)"

Translate OID into object name or object name into OID to receive object details

Enter OID or object name: [Translate](#)

examples -
OID: 1.3.6.1.4.1.9.9.27
Object Name: ifIndex

Object Information

Specific Object Information	
Object	agentSnmpCommunityName
OID	1.3.6.1.4.1.14179.1.2.5.5.1.1
Type	Display String
Permission	read-create
Status	current
MIB	AIRESpace-Switching-MIB ; - View Supporting Images
Description	"The switch's Snmp Community Name This name identifies each SNMP community; the name can be up to 16 characters, and it is case-sensitive. Community names in the SNMP community must be unique. If you make multiple entries using the same community name, the first entry is kept and processed and all duplicate entries are ignored."

Permission: "read-create" => still, access was somehow restricted (views?).

- **Get names of all users, incl. local_admins**

- **Unfortunately, passwords are obfuscated**
 - ... and can't be overridden (*read-create* OIDs)

But hey...

- Why (re-) set password of existing user if new (admin) users can be created? ;-)

Summary & Outlook

- “Enterprise WLAN solutions” might be complex beasts.
- Be aware that there might be some obvious or not-so-obvious security vulnerabilities.
- Use *common sense* when deploying ;-)
- All these kinds of problems are not specific to Cisco or to WLANs.

Shameless Announcements

- **Tool “LOKI” to be released in july 2010**
 - Multi function router attack tool with GUI
(think: “yersinia on layer 3”)
- **Updated version of this talk + code in the next months.**

There's never enough time...

THANK YOU...

...for yours!
